

Water Ionizers Part 4

by Cathleen LoGrasso

One of the things I like about the newer machines,
the worksheets

0:05

the ones that we offer,

0:08

are - you can get a fairly inexpensive

0:13

machine which will do a great job and give you lots of
alkaline water.

Yes. A lot of people who think that an alkaline water
machine is expensive ...you really just need to do the
math.

I, just in five minutes or less can figure out...

0:36

you divide the cost of the machine by three hundred sixty
five days

0:41

and about again by five years which is just your warranty
period

0:46

and for

0:49

let's say a

0:52

more expensive than average machine with the

0:56

eighteen hundred dollars I would say, because this
machine is eight hundred seventy five

1:01

And, its a perfectly adequate machine for normal sized family.

1:05

But some people will spend you know eighteen, nineteen hundred on

1:09

ambition...it's well worth it,

1:11

but the bottom line there is...you do that math and divide it by

1:17

that many days in a year and that many years...

1:20

it comes up to maybe less than fifty cents a day.

1:23

Well, that's just for five years and if you multiply it by two or three times how... Oh, yeah...

1:29

you're looking at virtually no cost.

1:35

Look at what people are doing, they're buying water in bottles at the store like crazy...

1:41

which are not alkaline.

1:42

Well...that's one of the things on my list here...

1:47

why should you not buy water in bottles?

1:50

Yeah,

1:52

it's not alkaline... you're right

1:54

a lot of times

1:55

it's not even neutral pH.

1:59

...and sometimes acidic.

2:02

Sometimes the water you buy in these bottles ...there's just no bottled water that's any good as far as alkalinity goes.
